Analytic function, Univalent function, Differential subordination, Superordination, Sandwich theorems.

#### ABSTRACT

In the present paper, we obtain some subordination and superordination results involving the differential operator  $\mathcal{W}_{\alpha,\beta}^{j,\delta}$  for certain normalized analytic functions in the open unit disk. These results are applied to obtain sandwich results.

### 1. Introduction

Let H = H(U) be the class of analytic functions in the open unit disk  $U = \{z \in \mathbb{C} : |z| < 1\}$ .

For n a positive integer and  $a \in \mathbb{C}$ . Let H[a, n] be the subclass of H consisting of functions of the form :

$$f(z) = a + a_n z^n + a_{n+1} z^{n+1} + \dots \qquad (a \in \mathbb{C}).$$
 (1.1)

Also, let *T* be the subclass of *H* consisting of functions of the form:

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n.$$
 (1.2)

Let  $f,g \in T$ . The function f is said to be subordinate to g, or g is said to be superordinate to f, if there exists a Schwarz function w analytic in U with w(0) = 0 and |w(z)| < 1 ( $z \in U$ ) such that f(z) = g(w(z)). In such a case we write f < g or f(z) < g(z) ( $z \in U$ ). If g is univalent in U, then f < g if and only if f(0) = g(0) and  $f(U) \subset g(U)$ .

Let  $p, h \in H$  and  $\psi(r, s, t; z)$ :  $\mathbb{C}^3 \times U \to \mathbb{C}$ . If p and  $\psi(p(z), zp'(z), z^2p''(z); z)$  are univalent functions in U and if p satisfies the second-order differential superordination

$$h(z) < \psi(p(z), zp'(z), z^2p''(z); z),$$
 (1.3)

then p is called a solution of the differential superordination (1.3). ( If f is subordinate to g, then g is superordinate to f ). An analytic function q is called a subordinant of (1.3), if q < p for all the functions p satisfying (1.3). An univalent subordinant  $\tilde{q}$  that satisfies  $q < \tilde{q}$  for all the subordinants q of (1.3) is called the best subordinant. Miller and Macanu [12] have obtained conditions on the functions h, q and  $\psi$  for which the following implication holds:

$$h(z) < \psi(p(z), zp'(z), z^2p''(z); z) \implies q(z) < p(z). \tag{1.4}$$

For  $\alpha \in R$  ,  $\beta \geq 0$  with  $\alpha + \beta > 0$  ,  $m, \delta \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}$  and f  $\epsilon$   $\mathcal{A}$  . The differential operator

$$\mathcal{W}_{\alpha,\beta}^{j,\delta}: T \longrightarrow T \text{ (see[10])}$$
 is defined by

$$\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z) = z + \sum_{n=2}^{\infty} \left[ \sum_{m=1}^{j} {j \choose m} (-1)^{m+1} \left( \frac{\alpha^m + n\beta^m}{\alpha^m + \beta^m} \right) \right]^{\delta} a_{n\,z^n}. \tag{1.5}$$

We note from (1.5) that, we have

$$z\left(\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)\right)' = \left[\!\!\left[\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\left(\left(\frac{\alpha}{\beta}\right)^{m}+1\right)\right]\!\!\right] \mathcal{W}_{\alpha,\beta}^{j,\delta+1}f(z) - \left[\!\!\left[\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\left(\frac{\alpha}{\beta}\right)^{m}\right]\!\!\right] \mathcal{W}_{\alpha,\beta}^{j,\delta}f(z) \,. \tag{1.6}$$

Ali et al. [1] obtained sufficient conditions for certain normalized analytic functions to satisfy

$$q_1(z) < \frac{zf'(z)}{f(z)} < q_2(z)$$

where  $q_1$  and  $q_2$  are given univalent functions in U with  $q_1(0) = q_2(0) = 1$ . Also, Tuneski [15] obtained a sufficient conditions for starlikeness of f in terms of the quantity  $\frac{f''(z)f(z)}{(f'(z))^2}$ . Recently,

Shanmugam et al. [13,14], Atshan et al. ([2], [3], [4], [5], [6], [7]), Goyal et al. [9] also obtained sandwich results for certain classes of analytic functions. The main object of the present paper is to find sufficient conditions for certain normalized analytic functions f to satisfy

$$q_1(z) \prec \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma} \prec q_2(z)$$

and

$$q_1(z) < \left(\frac{w_{\alpha,\beta}^{j,\delta+1}f(z)}{w_{\alpha,\beta}^{j,\delta}f(z)}\right)^{\gamma} < q_2(z),$$

where  $q_1$  and  $q_2$  are given univalent functions in U with  $q_1(0) = q_2(0) = 1$ .

## 2. Preliminaries

In order to prove our subordination and superordination results, we need the following definition and lemmas.

**Definition 2.1 [11].** Denote by Q the set of all functions f that are analytic and injective on  $\overline{U} \setminus E(f)$ , where  $\overline{U} = U \cup \{z \in \partial U\}$  and

$$E(f) = \{ \zeta \in \partial U: \lim_{z \to \zeta} f(z) = \infty \}$$
 (2.1)

and are such that  $f'(\zeta) \neq 0$  for  $\zeta \in \partial U \setminus E(f)$ . Further, let the subclass of Q for which f(z) = a be denoted by  $Q(a), Q(0) = Q_0$  and  $Q(1) = Q_1 = \{f \in Q : f(0) = 1\}$ .

**Lemma 2.1 [11].** Let q be univalent in the unit disk U and let  $\theta$  and  $\phi$  be analytic in a domain D containing q(U) with  $\phi(w) \neq 0$  when  $w \in q(U)$ . Set  $Q(z) = zq'(z)\phi(q(z))$  and  $h(z) = \theta(q(z)) + Q(z)$ . Suppose that

(i) Q(z) is starlike univalent in U,

(ii) 
$$Re\left\{\frac{zh'(z)}{Q(z)}\right\} > 0$$
 for  $z \in U$ .

If p is analytic in U, with  $p(0) = q(0), p(U) \subset D$  and

$$\theta(p(z)) + zp'(z)\phi(p(z)) < \theta(q(z)) + zq'(z)\phi(q(z)),$$
then  $p < q$  and  $q$  is the best dominant of (2.2).

**Lemma 2.2 [12].** Let q be a convex univalent function in U and let  $\alpha \in \mathbb{C}$ ,  $\beta \in \mathbb{C} \setminus \{0\}$  with

$$Re\left\{1+\frac{zq''(z)}{q'(z)}\right\} > \max\left\{0,-Re\left(\frac{\alpha}{\beta}\right)\right\}.$$

If p is analytic in U and

$$\alpha p(z) + \beta z p'(z) < \alpha q(z) + \beta z q'(z), \tag{2.3}$$

then p < q and q is the best dominant of (2.3).

**Lemma 2.3** [12]. Let q be convex univalent in U and let  $\beta \in \mathbb{C}$ . Further assume that  $Re(\beta) > 0$ .

If  $p \in H[q(0),1] \cap Q$  and  $p(z) + \beta z p'(z)$  is univalent in U, then

$$q(z) + \beta z q'(z) < p(z) + \beta z p'(z), \tag{2.4}$$

which implies that q < p and q is the best subordinant of (2.4).

**Lemma 2.4** [8]. Let q be convex univalent in the unit disk U and let  $\theta$  and  $\phi$  be analytic in a domain D containing q(U). Suppose that

(i) 
$$Re\left\{\frac{\theta'(q(z))}{\phi(q(z))}\right\} > 0 \text{ for } z \in U$$
,

(ii) $Q(z) = zq'(z)\phi(q(z))$  is starlike univalent in U.

If  $p \in H[q(0),1] \cap Q$ , with  $p(U) \subset D$ ,  $\theta(p(z)) + zp'(z)\phi(p(z))$  is univalent in U and

$$\theta(q(z)) + zq'(z)\phi(q(z)) < \theta(p(z)) + zp'(z)\phi(p(z)), \tag{2.5}$$

then q < p and q is the best subordinant of (2.5).

## 3. Subordination Results

**Theorem 3.1.** Let q be convex univalent in U with q(0) = 1,  $0 \neq \varepsilon \in \mathbb{C}$ ,  $\gamma > 0$  and suppose that q satisfies

$$Re\left\{1 + \frac{zq''(z)}{q'(z)}\right\} > \max\left\{0, -Re\left(\frac{\gamma}{\varepsilon}\right)\right\}.$$
 (3.1)

If  $f \in T$  satisfies the subordination

$$\left[1 - \sum_{m=1}^{j} {j \choose m} (-1)^{m+1} \left(\left(\frac{\alpha}{\beta}\right)^{m} + 1\right)\right] \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z}\right)^{\gamma} + \sum_{m=1}^{j} {j \choose m} (-1)^{m+1} \left(\left(\frac{\alpha}{\beta}\right)^{m} + 1\right) \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z}\right)^{\gamma} \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}\right) 
< q(z) + \frac{\varepsilon}{\gamma} z q'(z),$$
(3.2)

then

$$\left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma} < q(z) \tag{3.3}$$

and q is the best dominant of (3.2).

**Proof.** Define the function p by

$$p(z) = \left(\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma}.$$
(3.4)

Differentiating (3.4) logarithmically with respect to z, we get

$$\frac{zp'(z)}{p(z)} = \gamma \left( \frac{z \left( w_{\alpha,\beta}^{j,\delta} f(z) \right)'}{w_{\alpha,\beta}^{j,\delta} f(z)} - 1 \right). \tag{3.5}$$

Now, in view of (1.6), we obtain the following subordination

$$\frac{zp'(z)}{p(z)} = \sum_{m=1}^{j} {j \choose m} \left(-1\right)^{m+1} \left( \left(\frac{\alpha}{\beta}\right)^m + 1 \right) \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)} - 1 \right).$$

Therefore,

$$\frac{zp'(z)}{\gamma} = \sum_{m=1}^{j} {j \choose m} \left(-1\right)^{m+1} \left(\left(\frac{\alpha}{\beta}\right)^m + 1\right) \left(\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma} \left(\frac{w_{\alpha,\beta}^{j,\delta+1}f(z)}{w_{\alpha,\beta}^{j,\delta}f(z)} - 1\right).$$

The subordination (3.2) from the hypothesis becomes

$$p(z) + \frac{\varepsilon}{\gamma} z p'(z) < q(z) + \frac{\varepsilon}{\gamma} z q'(z).$$

An application of Lemma 2.2 with  $\beta = \frac{\varepsilon}{\gamma}$  and  $\alpha = 1$ , we obtain (3.3).

Putting  $q(z) = \left(\frac{1+z}{1-z}\right)^{\sigma}$  (0 <  $\sigma \le 1$ ) in Theorem 3.1, we obtain the following corollary:

**Corollary 3.1.** Let  $0 < \sigma \le 1, 0 \ne \varepsilon \in \mathbb{C}, \gamma > 0$  and

$$Re\left\{\frac{1+2\sigma z+z^2}{1-z^2}\right\} > \max\left\{0, -Re\left(\frac{\gamma}{\varepsilon}\right)\right\}.$$

If  $f \in T$  satisfies the subordination

$$\begin{split} \left[\!\!\left[1 - \sum_{m=1}^{j} \binom{j}{m} (-1)^{m+1} \left( \left(\frac{\alpha}{\beta}\right)^m + 1 \right) \right] \!\! \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} + \sum_{m=1}^{j} \binom{j}{m} \left(-1\right)^{m+1} \left( \left(\frac{\alpha}{\beta}\right)^m + 1 \right) \!\! \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)} \right) \\ & < \left( 1 + \frac{2\varepsilon\sigma z}{\gamma(1-z^2)} \right) \!\! \left( \frac{1+z}{1-z} \right)^{\sigma}, \end{split}$$

then

$$\left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma} \prec \left(\frac{1+z}{1-z}\right)^{\sigma}$$

and  $q(z) = \left(\frac{1+z}{1-z}\right)^{\sigma}$  is the best dominant.

**Theorem 3.2.** Let q be convex univalent in U with q(0) = 1,  $q(z) \neq 0$  ( $z \in U$ ) and assume that q satisfies

$$Re\left\{1 + \frac{xm}{\varepsilon} + \frac{y(m+1)}{\varepsilon}q(z) + (m-1)\frac{zq'(z)}{q(z)} + \frac{zq''(z)}{q'(z)}\right\} > 0,\tag{3.6}$$

where  $x, y, m \in \mathbb{C}$ ,  $\varepsilon \in \mathbb{C} \setminus \{0\}$  and  $z \in U$ .

Suppose that  $z(q(z))^{m-1}q'(z)$  is starlike univalent in U . If  $f \in T$  satisfies

$$\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z) < (x + yq(z))(q(z))^{m} + \varepsilon z(q(z))^{m-1}q'(z), \tag{3.7}$$

where

$$\Omega(x,y,\gamma,j,\alpha,m,\beta,\varepsilon;z) = x \left(\frac{w_{\alpha,\beta}^{j,\delta+1}f(z)}{w_{\alpha,\beta}^{j,\delta}f(z)}\right)^{\gamma m} + y \left(\frac{w_{\alpha,\beta}^{j,\delta+1}f(z)}{w_{\alpha,\beta}^{j,\delta}f(z)}\right)^{\gamma(m+1)} \\ + \varepsilon \gamma \left(\frac{w_{\alpha,\beta}^{j,\delta+1}f(z)}{w_{\alpha,\beta}^{j,\delta}f(z)}\right) \left(\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{w_{\alpha,\beta}^{j,\delta+1}f(z)}\right)^{\gamma m}, (\gamma > 0, z \in U), (3.8)$$

then

$$\left(\frac{w_{\alpha,\beta}^{j,\delta+1}f(z)}{w_{\alpha,\beta}^{j,\delta}f(z)}\right)^{\gamma} < q(z)$$
(3.9)

and q is the best dominant of (3.7).

**Proof.** Define the function p by

$$p(z) = \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}\right)^{\gamma}.$$
(3.10)

By setting

$$\theta(w) = (x + vw)w^m$$
 and  $\phi(w) = \varepsilon w^{m-1}, w \neq 0$ .

we see that  $\theta(w)$  is analytic in  $\mathbb{C}$ ,  $\phi(w)$  is analytic in  $\mathbb{C}\setminus\{0\}$  and that  $\phi(w)\neq 0, w\in\mathbb{C}\setminus\{0\}$ . Also, we get

$$Q(z) = zq'(z)\phi(q(z)) = \varepsilon z(q(z))^{m-1}q'(z)$$

and

$$h(z) = \theta(q(z)) + Q(z) = (x + yq(z))(q(z))^m + \varepsilon z(q(z))^{m-1}q'(z).$$

It is clear that Q(z) is starlike univalent in U,

$$Re\left\{\frac{zh'(z)}{Q(z)}\right\} = Re\left\{1 + \frac{xm}{\varepsilon} + \frac{y(m+1)}{\varepsilon}q(z) + (m-1)\frac{zq'(z)}{q(z)} + \frac{zq''(z)}{q'(z)}\right\} > 0.$$

By a straightforward computation, we obtain

$$(x + yp(z))(p(z))^m + \varepsilon z(p(z))^{m-1}p'(z) = \Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z), \tag{3.11}$$

where is given  $\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z)$  by (3.8).

From (3.7) and (3.11), we have

$$(x + yp(z))(p(z))^{m} + \varepsilon z(p(z))^{m-1}p'(z) < (x + yq(z))(q(z))^{m} + \varepsilon z(q(z))^{m-1}q'(z).$$
(3.12)

Therefore, by Lemma 2.1, we get p(z) < q(z). By using (3.10), we obtain the result.

Putting  $q(z) = \frac{1+Az}{1+Bz}$  ( $-1 \le B < A \le 1$ ) in Theorem 3.2, we obtain the following corollary:

**Corollary 3.2.** Let  $-1 \le B < A \le 1$  and

$$Re\left\{\frac{xm}{\varepsilon} + \frac{y(m+1)(1+Az)}{\varepsilon(1+Bz)} + \frac{1+m(A-B)z-ABz^2}{(1+Az)(1+Bz)}\right\} > 0,$$

where  $x, y, m \in \mathbb{C}$ ,  $\varepsilon \in \mathbb{C} \setminus \{0\}$  and  $z \in U$ . If  $f \in T$  satisfies

$$\Omega(x,y,\gamma,j,\alpha,m,\beta,\varepsilon;z) \prec \left(x+y\left(\frac{1+Az}{1+Bz}\right)\right)\left(\frac{1+Az}{1+Bz}\right)^m + \frac{\varepsilon(A-B)(1+Az)^{m-1}z}{(1+Bz)^{m+1}},$$

where is given  $\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z)$  by (3.8),

then

$$\left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1}f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}\right)^{\gamma} < \frac{1+Az}{1+Bz}$$

and  $q(z) = \frac{1+Az}{1+Bz}$  is the best dominant.

## 4. Superordination Results

**Theorem 4.1.** Let q be convex univalent in U with q(0) = 1,  $\gamma > 0$  and  $Re\{\varepsilon\} > 0$ . Let  $f \in T$ satisfies

$$\left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma}\in H[q(0),1]\cap Q$$

and

$$\left[\!\left[1-\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\left(\frac{\alpha}{\beta}\right)^{m}+1\right)\right]\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\left(\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma}\,\left(\!\frac{w_{\alpha,\beta}^{j,\delta+1}f(z)}{w_{\alpha,\beta}^{j,\delta}f(z)}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\left(\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma}\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\left(\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\,\left(\!\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\left(\!\frac{\alpha}{\beta}\right)^{m}+1\right)\!\left(\!\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\!\right)^{\gamma} +\varepsilon\sum_{m=1}^{j}\binom{j}{m}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left(-1\right)^{m+1}\left($$

be univalent in *U*. If

$$q(z) + \frac{\varepsilon}{\gamma} z q'(z) < \left[1 - \varepsilon \sum_{m=1}^{j} \binom{j}{m} (-1)^{m+1} \left( \left(\frac{\alpha}{\beta}\right)^m + 1 \right) \right] \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \\ + \varepsilon \sum_{m=1}^{j} \binom{j}{m} (-1)^{m+1} \left( \left(\frac{\alpha}{\beta}\right)^m + 1 \right) \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)} \right), (4.1)$$

then

$$q(z) < \left(\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma}$$
 (4.2)

and q is the best subordinant of (4.1).

**Proof.** Define the function p by

$$p(z) = \left(\frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma}.$$
(4.3)

Differentiating (4.3) with respect to z logarithmically, we get

$$\frac{zp'(z)}{p(z)} = \gamma \left( \frac{z \left( \mathcal{W}_{\alpha,\beta}^{j,\delta} f(z) \right)'}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)} - 1 \right). \tag{4.4}$$

After some computations and using (1.6), from (4.4), we obtain

$$\begin{split} & \left[ \left[ 1 - \varepsilon \sum_{m=1}^{j} \binom{j}{m} \left( -1 \right)^{m+1} \, \left( \left( \frac{\alpha}{\beta} \right)^{m} + 1 \right) \right] \left( \frac{W_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} + \varepsilon \sum_{m=1}^{j} \binom{j}{m} \left( -1 \right)^{m+1} \, \left( \left( \frac{\alpha}{\beta} \right)^{m} + 1 \right) \left( \frac{W_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \, \left( \frac{W_{\alpha,\beta}^{j,\delta+1} f(z)}{W_{\alpha,\beta}^{j,\delta} f(z)} \right) \\ &= p(z) + \frac{\varepsilon}{\gamma} z p'(z), \end{split}$$

and now, by using Lemma 2.3, we get the desired result.

Putting  $q(z) = \left(\frac{1+z}{1-z}\right)^{\sigma}$  (0 <  $\sigma \le 1$ ) in Theorem 4.1, we obtain the following corollary:

**Corollary 4.1.** Let  $0 < \sigma \le 1, \gamma > 0$  and  $Re\{\varepsilon\} > 0$ . If  $f \in T$  satisfies

$$\left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma}\in H\left[q(0),1\right]\cap Q$$

and

$$\left[ 1 - \varepsilon \sum_{m=1}^{j} \binom{j}{m} \; (-1)^{m+1} \; \left( \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \right] \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \\ + \varepsilon \sum_{m=1}^{j} \binom{j}{m} \; (-1)^{m+1} \; \left( \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)} \right)^{\gamma} \\ + \varepsilon \sum_{m=1}^{j} \binom{j}{m} \; (-1)^{m+1} \; \left( \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \\ + \varepsilon \sum_{m=1}^{j} \binom{j}{m} \; (-1)^{m+1} \; \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \\ + \varepsilon \sum_{m=1}^{j} \binom{j}{m} \; \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \\ + \varepsilon \sum_{m=1}^{j} \binom{j}{m} \; \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \\ + \varepsilon \sum_{m=1}^{j} \binom{j}{m} \; \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \left( \frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \; \left( \frac{\mathcal{W}_{$$

be univalent in U. If

$$\left(1 + \frac{2\varepsilon\sigma z}{\gamma(1-z^2)}\right) \left(\frac{1+z}{1-z}\right)^{\sigma} 
 < \left[1 - \varepsilon \sum_{m=1}^{j} {j \choose m} (-1)^{m+1} \left(\left(\frac{\alpha}{\beta}\right)^m + 1\right)\right] \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z}\right)^{\gamma} 
 + \varepsilon \sum_{m=1}^{j} {j \choose m} (-1)^{m+1} \left(\left(\frac{\alpha}{\beta}\right)^m + 1\right) \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}{z}\right)^{\gamma} \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}\right),$$

then

$$\left(\frac{1+z}{1-z}\right)^{\sigma} \prec \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma}$$

and  $q(z) = \left(\frac{1+z}{1-z}\right)^{\sigma}$  is the best subordinant.

**Theorem 4.2.** Let q be convex univalent in U with q(0) = 1, and assume that q satisfies

$$Re\left\{\frac{xm}{\varepsilon}q'(z) + \frac{y(m+1)}{\varepsilon}q(z)q'(z)\right\} > 0,\tag{4.5}$$

where  $x, y, m \in \mathbb{C}$ ,  $\varepsilon \in \mathbb{C} \setminus \{0\}$  and  $z \in U$ .

Suppose that  $z\big(q(z)\big)^{m-1}q'(z)$  is starlike univalent in U . Let  $f\in T$  satisfies

$$\left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1}f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}\right)^{\gamma} \in H\left[q(0),1\right] \cap Q$$

and  $\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z)$  is univalent in U, where is given  $\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z)$  by (3.8). If

$$(x + yq(z))(q(z))^{m} + \varepsilon z(q(z))^{m-1}q'(z) < \Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z), \tag{4.6}$$

then

$$q(z) < \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}\right)^{\gamma} \tag{4.7}$$

and q is the best subordinant of (4.6).

**Proof.** Define the function p by

$$p(z) = \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1} f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta} f(z)}\right)^{\gamma}.$$
(4.8)

By setting

$$\theta(w) = (x + yw)w^m$$
 and  $\phi(w) = \varepsilon w^{m-1}, w \neq 0$ ,

we see that  $\theta(w)$  is analytic in  $\mathbb{C}$ ,  $\phi(w)$  is analytic in  $\mathbb{C}\setminus\{0\}$  and that  $\phi(w)\neq 0, w\in\mathbb{C}\setminus\{0\}$ . Also, we get

$$Q(z) = zq'(z)\phi(q(z)) = \varepsilon z(q(z))^{m-1}q'(z).$$

It is clear that Q(z) is starlike univalent in U,

$$Re\left\{\frac{\theta'(q(z))}{\phi(q(z))}\right\} = Re\left\{\frac{xm}{\varepsilon}q'(z) + \frac{y(m+1)}{\varepsilon}q(z)q'(z)\right\} > 0.$$

By a straight forward computation, we obtain

$$\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z) = \left(u + vp(z)\right) \left(p(z)\right)^m + \eta z \left(p(z)\right)^{m-1} p'(z), \tag{4.9}$$

where  $\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z)$  is given by (3.8).

From (4.6) and (4.9), we have

$$(x + yq(z))(q(z))^{m} + \varepsilon z(q(z))^{m-1}q'(z) < (x + yp(z))(p(z))^{m} + \varepsilon z(p(z))^{m-1}p'(z).$$
 (4.10)

Therefore, by Lemma 2.4, we get q(z) < p(z). By using (4.8), we obtain the result.

### 5. Sandwich Results

Concluding the results of differential subordination and superordination, we arrive at the following "sandwich results".

**Theorem 5.1.** Let  $q_1$  be convex univalent in U with  $q_1(0) = 1$ ,  $Re\{\varepsilon\} > 0$  and let  $q_2$  be univalent in U,  $q_2(0) = 1$  and satisfies (3.1). Let  $f \in T$  satisfies

$$\left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma}\in H\left[1,1\right]\cap Q$$

and

$$\left[ \left[ 1 - \varepsilon \sum_{m=1}^{j} {j \choose m} (-1)^{m+1} \left( \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \right] \left( \frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z} \right)^{\gamma} + \varepsilon \sum_{m=1}^{j} {j \choose m} (-1)^{m+1} \left( \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \left( \frac{w_{\alpha,\beta}^{j,\delta}f(z)}{z} \right)^{\gamma} \left( \frac{w_{\alpha,\beta}^{j,\delta+1}f(z)}{w_{\alpha,\beta}^{j,\delta}f(z)} \right)^{\gamma} \right)$$

be univalent in U. If

$$\begin{split} q_1(z) + \frac{\varepsilon}{\gamma} z q_1{}'(z) &< \left[ \left[ 1 - \varepsilon \sum_{m=1}^j \binom{j}{m} \left( -1 \right)^{m+1} \left( \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \right] \left( \frac{w_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} + \varepsilon \sum_{m=1}^j \binom{j}{m} \left( -1 \right)^{m+1} \left( \left( \frac{\alpha}{\beta} \right)^m + 1 \right) \left( \frac{w_{\alpha,\beta}^{j,\delta} f(z)}{z} \right)^{\gamma} \left( \frac{w_{\alpha,\beta}^{j,\delta+1} f(z)}{w_{\alpha,\beta}^{j,\delta} f(z)} \right) &< q_2(z) + \frac{\varepsilon}{\gamma} z q_2{}'(z), \end{split}$$

then

$$q_1(z) < \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}{z}\right)^{\gamma} < q_2(z)$$

and  $q_1$  and  $q_2$  are, respectively, the best subordinant and the best dominant.

**Theorem 5.2.** Let  $q_1$  be convex univalent in U with  $q_1(0) = q_2(0) = 1$ . suppose  $q_1$  satisfies (4.5) and  $q_2$  satisfies (3.6). Let  $f \in T$  satisfies

$$\left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1}f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}\right)^{\gamma} \in H\left[1,1\right] \cap Q$$

and  $\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z)$  is univalent in U, where  $\Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z)$  is given by (3.8). If

$$(x + yq_1(z))(q_1(z))^m + \varepsilon z(q_1(z))^{m-1}q_1'(z) < \Omega(x, y, \gamma, j, \alpha, m, \beta, \varepsilon; z)$$

$$< (x + yq_2(z))(q_2(z))^m + \varepsilon z(q_2(z))^{m-1}q_2'(z),$$

then

$$q_1(z) \prec \left(\frac{\mathcal{W}_{\alpha,\beta}^{j,\delta+1}f(z)}{\mathcal{W}_{\alpha,\beta}^{j,\delta}f(z)}\right)^{\gamma} \prec q_2(z)$$

and  $q_1$  and  $q_2$  are, respectively, the best subordinant and the best dominant.
