\textbf{ARTICLE INFO}

\textbf{ABSTRACT}

In this paper, the influence of magnetohydrodynamic (MHD) on a mixed convective heat and mass transfer analysis for the peristaltic transport of viscoplastic fluid in a non-uniform two dimensional tapered asymmetric channel with porous medium is investigated. The governed equations that described the motion of flow are simplified under assumptions of low Reynolds number and long wavelength. These equations are solved by mean of the regular perturbation method which is restricted to the smaller values of Bingham and Grashof numbers. Series solution for the axial velocity, temperature and concentration distribution have been computed. The flow quantities have been illustrated graphically for different interesting parameters. The trapping phenomena is also examined graphically.

\textbf{1. Introduction}

Peristaltic is a phenomenon of fluid transport induced by progressive of sinusoidal waves along the flexible walls of channels. This mechanism widely occurs in many industrial and biomedical application such as flow of lymph through lymphatic vessels, swallowing of food through esophagus, urine flow from the kidney to bladder, blood circulation in small blood vessels etc. Many of the physiological fluid (lymph, blood etc.) are noted to be non-Newtonian in nature. Many modern biomedical and mechanical instruments like blood pumps, the roller and finger pumps and heart-lung machines have been designed on the principle of peristaltic. In recent years, the combined effected of heat and mass transfer on peristaltic transport of non-Newtonian fluid in present of magnetic field receive considerable attentions due to its application in biomedical sciences [1-3]. Many researcher have been made theoretical analysis and various experimental to understand the peristaltic flow in both physiological and mechanical phenomenon under various assumption. Srinivas and Kothandapani [4] investigated the influence of heat and mass transfer on MHD peristaltic flow through porous space with compliant walls. Effect of heat and mass transfer on peristaltic flow of a Bingham fluid in the presence of inclined magnetic field and channel with different wave forms is studied by Akram et al. [5]. Ramesh [6] discussed the influence of heat and mass transfer on peristaltic flow of a couple stress fluid through porous medium in

Communicated by : Alaa Hussien Hamadi
the presence of inclined magnetic field in an inclined asymmetric channel. The effect of wall properties on the convective peristaltic transport of a conducting Bingham fluid through porous medium is examined by Satyanarayana et al. [7]. Lakshminarayana et al. [8] studied the peristaltic slip flow of a Bingham fluid in an inclined porous conduit with Joule heating. Adnan and Abdulhadi [9] analyzed the effect of a magnetic fluid on peristaltic transport of Bingham plastic fluid in a symmetric channel. Murad and Abdulhadi [10] studied the influence of heat and mass transfer on peristaltic transport of viscoplastic fluid in presence of magnetic field through symmetric channel with porous medium.

In this paper, the influence of MHD on mixed convective heat and mass transfer analysis for the peristaltic transport of viscoplastic fluid with porous medium in tapered channel is investigated under the assumption of low Reynolds number and long wavelength. The expression of velocity, temperature, concentration is obtained by using perturbation method. Furthermore trapping phenomenon is also analyzed in detail.

2. Mathematical Formulation

Consider a peristaltic transport of an incompressible MHD viscoplastic fluid in a non-uniform two dimensional tapered asymmetric channel of width \((a_1 + a_2)\) with porous medium. Figure (1) gives the schematic diagram of the asymmetric channel. The flow is generated by propagation of wave on the channel walls train moving ahead with constant speed \(c\), but with different wave amplitudes, phase angle and channel widths. Let \(H_1\) and \(H_2\) be the right side wall and the left side wall respectively in the stationary frame of reference \((X, Y)\). The uniform magnetic field is applied in Y-direction to study the effect of it on the fluid flow. Electric field is absent. Heat and mass transfer studied through convective condition. The geometries of the channel walls are given by [11,12]

\[
\begin{align*}
\mathcal{Y} &= H_1(X,T) = a_1 + bX + \phi_1 \cos \left( \frac{2\pi}{\lambda} (X - cT) \right) \\
\mathcal{Y} &= H_2(X,T) = -a_2 - bX - \phi_2 \cos \left( \frac{2\pi}{\lambda} (X - cT) + \phi \right)
\end{align*}
\]

(1)

for the right hand side wall, and

\[
\begin{align*}
\mathcal{Y} &= H_1(X,T) = a_1 + bX + \phi_1 \cos \left( \frac{2\pi}{\lambda} (X - cT) \right) \\
\mathcal{Y} &= H_2(X,T) = -a_2 - bX - \phi_2 \cos \left( \frac{2\pi}{\lambda} (X - cT) + \phi \right)
\end{align*}
\]

(2)

for the left hand side wall, where \(b\) is the non-uniform parameter, \(\phi_1\) and \(\phi_2\) are the wave amplitudes, \(\lambda\) is the wavelength, \(T\) is the time, \(\phi\) is the phase difference which varies in the range \(0 \leq \phi \leq \pi\). Moreover \(\phi = 0\) corresponds to the symmetric channel with waves out of phase and \(\phi = \pi\) represents that the wave is in phase. Further \(a_1\), \(a_2\), \(\phi_1\), \(\phi_2\) and \(\phi\) satisfy the condition \(\phi_1 + \phi_2 + 2\phi_1\phi_2 \cos \phi \leq (a_1 + a_2)^2\) so that the walls not intersect with each other.

Fig. (1)- Schematic diagram of the asymmetric channel.

3. Basic and Constitutive Equations

Based on the above consideration, the basic governing equations that describe the flow in the present problem are given by [9,13]

\[
\begin{align*}
\nabla \cdot \mathbf{V} &= 0, \\
\rho \frac{d\mathbf{V}}{dt} &= \nabla \sigma + \rho g \alpha (T - T_0) + \mathbf{J} \times \mathbf{B} - \frac{n}{k_o} \nabla T, \\
\rho C_p \frac{dT}{dt} &= \kappa \nabla^2 T + \sigma \cdot (\nabla \mathbf{V}), \\
\frac{dC}{dt} &= D_m \nabla^2 C + \frac{D_n K C}{\tau_m} \nabla^2 T,
\end{align*}
\]

(3)-(6)
in which $\mathbf{V}$ is the velocity, $\rho$ is the density, $\frac{d}{dt}$ is the material time derivative, $\alpha$ is the coefficient of thermal expansion, $\bar{\sigma}$ is the Cauchy stress tensor, $g$ is the acceleration due to gravity, $J = \sigma'(\mathbf{V} \times \mathbf{B})$ is the current density, $\mathbf{B} = (0, B_0, 0)$ is the magnetic field, $\sigma'$ is the electrical conductivity, $\eta$ is the viscosity, $k_0$ is the permeability parameter of porous medium, $\nabla^2$ is the Laplace operator, $T$ is the temperature, $\kappa$ is the thermal conductivity, $C_p$ is the specific heat, $\bar{C}$ is the mass concentration, $D_m$ is the coefficient of mass diffusion, $K_f$ is the thermal diffusion ratio and $T_m$ is the mean temperature.

The term $(\bar{\sigma} \cdot (\nabla \mathbf{V}))$ in equation (5) can be compute from the definition of dot product of two tensor (if $\mathbf{B}$ and $\bar{\mathbf{B}}$ are any two tensor then $\mathbf{B} \cdot \bar{\mathbf{B}} = \text{tr}(\mathbf{B} \bar{\mathbf{B}})$). Let $U$ and $V$ be the velocity components along the $X$ and $Y$-directions respectively in the fixed frame, the velocity vector $\mathbf{V}$ can be written as

$$\mathbf{V} = (U(\bar{X}, \bar{Y},\bar{t}), V(\bar{X}, \bar{Y},\bar{t})), 0), \tag{7}$$

The Bingham plastic fluid is considered and the constitutive equations can be defined as [3,9]

$$\bar{\sigma} = -\bar{\rho} \mathbf{I} + \bar{\tau}, \tag{8}$$

$$\bar{\tau} = 2\eta \mathbf{D} + 2\tau_0 \bar{\mathbf{D}}, \tag{9}$$

in above equations, $\bar{\tau}$ is the extra tensor, $\mathbf{I}$ is the identity tensor, $\bar{\rho}$ is the pressure while the rate of deformation tensor $\mathbf{D}$ and the tensor $\bar{\mathbf{D}}$ are defined by

$$\mathbf{D} = \frac{1}{2} (\nabla \mathbf{V} + (\nabla \mathbf{V})^T), \quad \bar{\mathbf{D}} = \frac{D}{\sqrt{2} tr(D^2)}. \tag{10}$$

From equations (3)-(8), the governing equation in the fixed frame are given by

$$\frac{\partial \mathbf{U}}{\partial \bar{t}} + \bar{\nabla} \mathbf{U} \cdot \mathbf{V} = \frac{\partial \rho}{\partial \bar{t}} \frac{\partial \mathbf{U}}{\partial \bar{X}} + \frac{\partial \sigma_{XX}}{\partial \bar{X}} + \frac{\partial \sigma_{XY}}{\partial \bar{Y}} + \frac{\partial \sigma_{YY}}{\partial \bar{Y}} - \rho g\alpha (T - T_0) - \sigma' B_0^2 \mathbf{U} - \frac{\eta}{k_0} \mathbf{U}, \tag{11}$$

$$\frac{\partial \mathbf{U}}{\partial \bar{t}} + \bar{\nabla} \mathbf{V} \cdot \mathbf{U} = \frac{\partial \rho}{\partial \bar{t}} \frac{\partial \mathbf{V}}{\partial \bar{X}} + \frac{\partial \sigma_{XY}}{\partial \bar{X}} + \frac{\partial \sigma_{YY}}{\partial \bar{Y}} - \frac{\eta}{\kappa_0} \mathbf{V}, \tag{12}$$

$$\left(\frac{\partial \mathbf{U}}{\partial \bar{t}} + \bar{\nabla} \mathbf{U} \cdot \mathbf{V} \right) \mathbf{U} = \kappa \left(\frac{\partial^2 \mathbf{U}}{\partial \bar{X}^2} + \frac{\partial^2 \mathbf{U}}{\partial \bar{Y}^2}\right) + \bar{\tau}_{XX} \frac{\partial \mathbf{U}}{\partial \bar{X}} + \bar{\tau}_{XY} \frac{\partial \mathbf{U}}{\partial \bar{Y}} + \bar{\tau}_{YY} \frac{\partial \mathbf{U}}{\partial \bar{Y}}, \tag{13}$$

$$\left(\frac{\partial \mathbf{U}}{\partial \bar{t}} + \bar{\nabla} \mathbf{V} \cdot \mathbf{V} \right) \mathbf{V} = \kappa \left(\frac{\partial^2 \mathbf{V}}{\partial \bar{X}^2} + \frac{\partial^2 \mathbf{V}}{\partial \bar{Y}^2}\right) + \bar{\tau}_{XY} \frac{\partial \mathbf{V}}{\partial \bar{X}} + \bar{\tau}_{YY} \frac{\partial \mathbf{V}}{\partial \bar{Y}}, \tag{14}$$

$$\left(\frac{\partial \mathbf{C}}{\partial \bar{t}} + \bar{\nabla} \mathbf{U} \cdot \mathbf{C} + \bar{\nabla} \mathbf{V} \cdot \mathbf{C} \right) \mathbf{C} = D_m \left(\frac{\partial^2 \mathbf{C}}{\partial \bar{X}^2} + \frac{\partial^2 \mathbf{C}}{\partial \bar{Y}^2}\right) + \frac{D_m K_f}{T_m} \left(\frac{\partial^2 \mathbf{C}}{\partial \bar{X}^2} + \frac{\partial^2 \mathbf{C}}{\partial \bar{Y}^2}\right). \tag{15}$$

The corresponding boundary conditions are

$$\begin{align*}
    U &= 0, \quad T = T_1, \quad \bar{C} = \bar{C}_1 \quad \text{at} \quad \bar{Y} = \bar{H}_1, \\
    U &= 0, \quad T = T_0, \quad \bar{C} = \bar{C}_0 \quad \text{at} \quad \bar{Y} = \bar{H}_2. \tag{16}
\end{align*}$$

In view of equations (9) and (10), the components of extra stress tensor in the fixed frame becomes

$$\bar{\tau}_{XX} = 2\eta \frac{\partial \mathbf{U}}{\partial \bar{X}} + \frac{2\tau_0 \frac{\partial \mathbf{U}}{\partial \bar{X}}}{\left(\frac{\partial \mathbf{U}}{\partial \bar{X}} + \frac{\partial \mathbf{V}}{\partial \bar{X}}\right)^2 + \left(\frac{\partial \mathbf{W}}{\partial \bar{X}} + \frac{\partial \mathbf{V}}{\partial \bar{X}}\right)^2},$$

$$\bar{\tau}_{XY} = \eta \frac{\partial \mathbf{U}}{\partial \bar{Y}} + \frac{\partial \mathbf{V}}{\partial \bar{X}} + \frac{\tau_0 \frac{\partial \mathbf{U}}{\partial \bar{Y}}}{\left(\frac{\partial \mathbf{U}}{\partial \bar{X}} + \frac{\partial \mathbf{V}}{\partial \bar{X}}\right)^2 + \left(\frac{\partial \mathbf{W}}{\partial \bar{X}} + \frac{\partial \mathbf{V}}{\partial \bar{X}}\right)^2},$$

$$\bar{\tau}_{YY} = 2\eta \frac{\partial \mathbf{V}}{\partial \bar{Y}} + \frac{2\tau_0 \frac{\partial \mathbf{V}}{\partial \bar{Y}}}{\left(\frac{\partial \mathbf{U}}{\partial \bar{X}} + \frac{\partial \mathbf{V}}{\partial \bar{X}}\right)^2 + \left(\frac{\partial \mathbf{W}}{\partial \bar{X}} + \frac{\partial \mathbf{V}}{\partial \bar{X}}\right)^2}. \tag{17}$$

Peristaltic motion is unsteady phenomenon in nature but it can be assumed steady by using the transformation from the laboratory frame (fixed frame) $(\bar{X}, \bar{Y})$ to the wave frame (move frame) $(\bar{x}, \bar{y})$ which defined as [3,12]

$$\bar{X} = \bar{x} - c \bar{t}, \quad \bar{Y} = \bar{y}, \quad \bar{u}(\bar{x}, \bar{y}) = \bar{U}(\bar{X}, \bar{Y}, \bar{t}) - c, \quad \bar{v}(\bar{x}, \bar{y}) = \bar{V}(\bar{X}, \bar{Y}, \bar{t}),$$

$$\bar{p}(\bar{x}, \bar{y}) = \bar{P}(\bar{X}, \bar{Y}, \bar{t}), \quad \bar{T}(\bar{x}, \bar{y}) = \bar{T}(\bar{X}, \bar{Y}, \bar{t}), \quad \bar{C}(\bar{x}, \bar{y}) = \bar{C}(\bar{X}, \bar{Y}, \bar{t}), \tag{18}$$

where $\bar{u}, \bar{w}$ and $\bar{p}$ are the velocity components and the pressure in the wave frame, respectively.

Now, we transform equations (1), (2) and (11)-(17) in wave frame with the help of equation (18) and normalize the resulting equations by using following non-dimensional quantities [3,12]
\( \ddot{\chi} = \lambda x, \dddot{\gamma} = a_1 y, \bar{u} = c u, \ddot{v} = c v, t = \frac{\alpha}{c} t, \bar{p} = \frac{cnl}{a_1^2} p, \)

\[
Re = \frac{\rho a_1 c_0}{\eta}, \phi_1 = a_1 \phi_1, \phi_2 = a_1 \phi_2, \delta \frac{a_1}{\lambda}, H_1 = a_1 H_1,
\]

\[
H_2 = a_1 H_2, \alpha = a_2 a_1, Q^* = a_1 c \Theta, \bar{q} = a_1 c F, \bar{k}_0 = a_2 \kappa_0,
\]

\[
\bar{b} = \frac{a_2 b}{a_1}, \bar{r} = \frac{c \eta}{a_1} \tau_{ij}, \bar{\psi} = c a_1 \psi, \theta = \frac{T-T_0}{T_1-T_0}, \Omega = \frac{c-c_0}{c_1-c_0}.
\]

\[
Pr = \frac{c \eta}{\kappa F}, Ec = \frac{c^2}{c p(T_1-T_0)}, Sc = \frac{\eta}{\rho B_m}, Sr = \frac{\rho B_m(T_1-T_0)k F}{\eta T_m(c_1-c_0)},
\]

\[
A^2 = M^2 + \frac{1}{k_0}, Bn = \frac{a_1 \sigma g}{c \eta}, M^2 = \frac{\sigma B_m a_2^2}{c \eta}, G_r = \frac{\rho a_1^2(T_1-T_0)}{c \eta}.
\]

to obtain

\[
y = H_1(x) = 1 + b x + \phi_1 \cos 2 \pi x,
\]

\[
y = H_2(x) = -a - b x - \phi_2 \cos 2 \pi x + \psi + \frac{\delta}{\kappa_0} v,
\]

\[
\delta \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0,
\]

\[
Re \left( (u+1) \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \right) = \frac{Gr}{\partial x} - A^2 (u + 1),
\]

\[
Re \left( (u+1) \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \right) = \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} + \frac{\partial^2 v}{\partial y^2} - \frac{\partial^2 v}{\partial x^2} - \delta \frac{1}{\kappa_0} v,
\]

\[
Re Pr \left( (u+1) \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \right) = \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} + \frac{\partial^2 v}{\partial y^2} - \frac{\partial^2 v}{\partial x^2} - \delta \frac{1}{\kappa_0} v,
\]

\[
Re \left( (u+1) \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \right) = \frac{1}{Sc} \left( \frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} \right) +
\]

\[
\frac{2 \delta}{\kappa_0} \frac{\partial u}{\partial x} + \frac{2Bn \delta}{\kappa_0} \frac{\partial^2 u}{\partial y^2} + \left( \frac{\delta \frac{\partial^2 \phi}{\partial x^2}}{\delta^2} \right) + \left( \frac{\partial^2 \phi}{\partial y^2} \right)^2,
\]

\[
\tau_{xx} = 2 \delta \frac{\partial u}{\partial x} + \frac{2Bn \delta}{\kappa_0} \frac{\partial^2 u}{\partial y^2} + \left( \frac{\delta \frac{\partial^2 \phi}{\partial x^2}}{\delta^2} \right) + \left( \frac{\partial^2 \phi}{\partial y^2} \right)^2,
\]

\[
\tau_{xy} = \tau_{yx} = \frac{\partial u}{\partial y} + \delta \frac{\partial v}{\partial x} + \left( \frac{\delta \frac{\partial^2 \phi}{\partial x^2}}{\delta^2} \right) + \left( \frac{\partial^2 \phi}{\partial y^2} \right)^2,
\]

\[
\tau_{yy} = 2 \frac{\partial v}{\partial y} + \frac{2Bn \delta}{\kappa_0} \frac{\partial^2 v}{\partial y^2} + \left( \frac{\delta \frac{\partial^2 \phi}{\partial x^2}}{\delta^2} \right) + \left( \frac{\partial^2 \phi}{\partial y^2} \right)^2,
\]

in the above expressions, \(T_1\) and \(T_0\) are the temperature at the right side wall and the left side wall respectively whereas \(C_1\) and \(C_0\) denoted the concentration at the right side wall and the left side wall of the channel respectively. \(\psi\) is the stream function, \(\delta\) is the dimensionless wave number, \(Re\) is the Reynolds number, \(Ec\) is the Eckert number, \(Pr\) is the Prandtl number, \(Sr\) is the Soret number, \(Sc\) is the Schmidt number, \(M\) is the Hartman number, \(Bn\) is the Bingham number, \(Gr\) is the Grashof number, \(\Omega\) is the non-dimensional concentration and \(\theta\) is the temperature in the non-dimensional form.

Introduction of dimensionless stream function(\(\psi\)) by the relations \(u = \psi_y\) and \(v = -\delta \psi_x\) in equations (22)-(28) shows that the continuity equation satisfies identically while other equations subjected to \(\delta \ll 1\) and \(Re \ll 1\), yields

\[
\frac{\partial \psi}{\partial x} = \frac{\partial}{\partial y} \tau_{xy} + Gr \theta - A^2 (\psi_y + 1),
\]

\[
\frac{\partial \psi}{\partial y} = 0,
\]

\[
\frac{\partial^2 \psi}{\partial y^2} = Br \tau_{xy} \psi_y + \frac{\partial^2 \theta}{\partial y^2} + \frac{2}{Sc S^2} \frac{\partial^2 \theta}{\partial y^2},
\]

\[
\frac{\partial^2 \psi}{\partial y^2} = -Sc S^2 \frac{\partial^2 \theta}{\partial y^2},
\]

\[
\psi_y = -1, \theta = 1, \Omega = 1 \quad at \ y = H_1
\]

\[
\psi_y = -1, \theta = 0, \Omega = 0 \quad at \ y = H_2,
\]

\[
\tau_{xx} = \tau_{yy} = 0, \ \tau_{xy} = \psi_y + B_n,
\]
where, $Br = EcPr$, is the Brinkman number.

By substituting equation (34) into equation (29) and deriving the result with respect to $y$, in view of equation (30), yields
\[
\psi_{yyy} + Gr \frac{\partial^2 \psi}{\partial y^2} - A^2 \psi_{yy} = 0.
\] (35)

From equation (31) and (34) we have
\[
\theta_{yy} = Br \left( \psi_{yy} + Br \psi_{yy} \right).
\] (36)

4. Rate of Volume Flow

At any instant the volume flow rate in the fixed frame reference $(\bar{X}, \bar{Y})$ is given by
\[
\bar{Q}(\bar{X}, \bar{Y}) = \int_{H_1(\bar{X}, \bar{Y})}^{H_2(\bar{X}, \bar{Y})} \bar{u}(\bar{X}, \bar{Y}, \bar{Y}) d\bar{Y},
\] (37)
while the expression for the volumetric flow rate in the wave frame of reference $(\bar{x}, \bar{y})$ is defined as
\[
\bar{q}(\bar{x}, \bar{y}) = \int_{H_1(\bar{x}, \bar{y})}^{H_2(\bar{x}, \bar{y})} \bar{u}(\bar{x}, \bar{y}) d\bar{y}.
\] (38)

Using equation (18) into equation (37) and making use of equation (38) we obtain the relation of the two fluxes as follows
\[
\bar{Q} = \bar{q} + c(H_1(\bar{x}) - H_2(\bar{x})).
\] (39)

The average volume flow rate over the period time $T = \frac{c}{\lambda}$ of the peristaltic wave at a fixed position $\bar{x}$ is defined as
\[
\bar{Q}^* = \frac{1}{T} \int_0^T \bar{Q} d\bar{t}.
\] (40)

Substituting equation (39) into equation (40), we have
\[
\bar{Q}^* = \bar{q} + ca_1 + ca_2 + 2c^2 b.
\] (41)

Using equation (19) $(\bar{q} = \frac{\partial \bar{Q}}{\partial \bar{y}}$, $F = \frac{\partial \theta}{\partial \bar{y}}$) into equation (41) we have
\[
\theta = F + 1 + a + 2b,
\] (42)
where $F$ is the dimensionless volume flow rate in the wave frame defined by
\[
F = \int_{H_1(\bar{x})}^{H_2(\bar{x})} \frac{\partial \psi}{\partial \bar{y}} d\bar{y} = \psi(H_1(\bar{x})) - \psi(H_2(\bar{x})),
\] (43)
then $\bar{y} = \frac{F}{2}$ at the right wall and $\bar{y} = -\frac{F}{2}$ at the left wall of the channel.

The non-dimension expression for pressure rise over one cycle of the wave is given by
\[
\Delta P_\lambda = \int_0^1 \frac{\partial \bar{p}}{\partial \bar{y}} d\bar{x},
\] (44)
which is difficult to evaluate directly, so we used MATHEMATICA software to compute it numerically.

5. Solution of the Problem

In above equations, we have a system of non-linear partial differential equations which is difficult to solve it exactly. So, had to resort to the application of an approximation method, via the regular perturbation method to solve it. Let us expand stream function and the concentration for small values of Bingham number $(Br \ll 1)$ and the temperature for small values of Grashof number $(Gr \ll 1)$ as follows
\[
\psi = \sum_{i=0}^{\infty} (Br)^i \psi_i + O(Bn^2),
\]
\[
\bar{\theta} = \sum_{i=0}^{\infty} (Gr)^i \bar{\theta}_i + O(Gr^2),
\]
\[
\bar{\Omega} = \sum_{i=0}^{\infty} (Bn)^i \bar{\Omega}_i + O(Bn^2).
\] (45)

Inserting equation (45) into equations (32), (35) and (36) with the corresponding boundary conditions (equation (33)) and then collecting the coefficients of like power of $Br$ and $Gr$ yields the zeroth and the first order systems.

5.1 Zeroth Order System
\[
\psi_{0yyy} - A^2 \psi_{0yy} = 0,
\] (46)
\[
\theta_{0yy} + Br \psi_{0yy} = 0,
\] (47)
\[
\bar{\Omega}_{0yy} + ScSr \theta_{0yy} = 0,
\] (48)

with the corresponding boundary conditions
\[
\begin{align*}
\psi_0 &= \frac{c}{2}, \psi_{0y} = -1, \theta_0 = 1, \bar{\Omega}_0 = 1 \quad \text{at} \quad y = H_1, \\
\psi_0 &= -\frac{c}{2}, \psi_{0y} = -1, \theta_0 = 0, \bar{\Omega}_0 = 0 \quad \text{at} \quad y = H_2.
\end{align*}
\] (49)

5.2 First Order System
\[
\psi_{1yyy} + \theta_{0y} - A^2 \psi_{1yy} = 0,
\] (50)
\[ \theta_{yy} + 2Br\psi_0\psi_y + \psi_{yy} = 0, \]
\[ \Omega_{yy} + ScSr\theta_{yy} = 0, \]
with the corresponding boundary conditions
\[ \psi_1 = 0, \psi_y = 0, \theta_1 = 0, \Omega_1 = 0 \text{ at } y = H_1 \]
\[ \psi_1 = 0, \psi_y = 0, \theta_1 = 0, \Omega_1 = 0 \text{ at } y = H_2 \]  

The final solution of the above systems (zeroth and first order) by using MATHEMATICA software with corresponding boundary conditions are
\[ \psi = \frac{c_1 e^{\beta_1 y} + c_2 e^{\beta_2 y}}{2} + c_3 + yc_4 - \frac{1}{2A^2} (Br(c_2 e^{-2\beta y} - c_1 e^{2\beta y} + 8A^3 c_1 c_2 y^3) - 12A^4 e^{-4\beta y} (c_6 e^{4\beta y} y^2 + 2(e^{4\beta y} c_9 + c_10)) + c_{11} + yc_{12}, \]
\[ \theta = \frac{Br(\frac{c_2 e^{-2\beta y} - c_1 e^{2\beta y} - 2Ac_1 c_2 y^2}{2A^2} + c_5 + yc_6}

\[ \Omega = \frac{1}{2} BrScSr \left( \frac{c_2 e^{-2\beta y} - c_1 e^{2\beta y}}{2A^2} + \frac{c_1 e^{2\beta y} - 2Ac_1 c_2 y^2}{2A^2} \right) + c_7 + yc_8 \]
\[ + \frac{1}{216A^4} e^{-\beta y} ScSr (108A^3 c_1 e^{2\beta y} (2c_10 + 2c_9 e^{2\beta y} + c_6 e^{4\beta y} y^2) - 8Br^2 (c_2^3 - c_1^3 e^{4\beta y} + 9c_1 c_2^2 e^{4\beta y} (-25 + 12A y) + 9c_1 c_2^2 e^{2\beta y} (25 + 12A y) + 9Br^2 e^{\beta y} (-c_2^2 + c_1^2 e^{4\beta y} + 48Ac_6 e^{4\beta y} (c_2 + c_1 e^{2\beta y}) + 24A^2 (c_1 c_10 + c_2 e^{2\beta y} y^2 + 4A^2 (3c_1 c_10 + 3c_1 c_9 e^{4\beta y} - 2c_1 c_2 e^{2\beta y} y^3)) + c_{15} + yc_{16}. \]
where \( c_i, i = 1, 2, \ldots, 16 \) are constants which are found by using the boundary conditions.

6. Results and Discussion
To study the effect of physical parameters such as Hartmann number (magnetic parameter) \( M \), permeability parameter \( k_o \), non-uniform parameter \( b \), amplitudes wave of right \( (\phi_1) \) and left \( (\phi_2) \) walls ,Bingham number \( Bn \), Brinkman number \( Br \), phase angle \( \phi \), Grashof number \( Gr \), flow rate \( F \), Schmit number \( Sc \), and Soret number\( Sr \), we have plotted the axial velocity \( u \), temperature \( \theta \), concentration \( \Omega \), and trapping phenomenon in Figures (2-39). All figures are plotted for the values \( M = 0.5, b = 0.2, k_o = 2, Bn = 0.001, Br = 6, F = 1.4, \phi = \pi/4, \phi_1 = 3, \phi_2 = 2, x = 0.1, Sc = 0.4 \) and \( Sr = 0.8 \) using MATHEMATICA software.

6.1 Velocity Distribution \( u \)
Graphical results are displayed in order to see the behavior of parameters involved in the axial velocity \( u \). The effect of different values of \( M, F, b, k_o, \phi_1, \phi, Bn \) and \( Br \) on \( u \) are explained in figures (2-10). The behavior of velocity distribution is parabolic as seen in figures. Figure (2) shows the influence of \( M \) on \( u \). It is noticed that with an increase of \( M \), the axial velocity increases at the left and right part of the channel, however, it decreases at the central part of the channel. The behavior of \( u \) is observed from figure (3) that \( u \) increases by increasing in \( F \) whereas it decreases by increasing in \( b \), as shown in figures (4). Figure (5) shows the impact of \( k_o \) on \( u \). It is noticed that at the left and right wall of the channel \( u \) decreases slowly with an increase of \( k_o \) however at the central part of the channel \( u \) increases. Figure (6) explained that \( u \) increases near the right wall and the middle part of the channel and the situation is opposite at the left wall of the channel with an increase in \( \phi_1 \). Figure (7) displays the effect of \( \phi_2 \) on \( u \). It is noticed that when an increase in \( \phi_2, u \) increases at the left wall of the channel and merges from the central part to the rest of the channel (no effected). From figure (8) we noted that at an increase in \( \phi \), \( u \) decreases at the left wall of the channel and merges from the central part to the right wall of the channel. Figure (9) illustrated the impact of \( Bn \) on \( u \). It is observed that the increase in \( Bn \) lead to \( u \) decreases at the left wall of the channel, while \( u \) increasing at the middle portion and then gradually disappear as there is no effect on axial velocity near the right wall of the channel. From figure (10) we observed that \( u \) do not change at an increasing in \( Br \). One can observe a very good agreement of our results for \( M, F, \phi_1, \phi_2 \) and \( \phi \) with those reported in Adnan and Abdulhadi [9].
6.2 Temperature Distribution $\theta$

The variation in temperature profile for different values of involved parameters are illustrated in figures (11-19). Figure (11) shows that the impact of $M$ on $\theta$. It is noticed that $\theta$ exhibits oscillating behavior with an increase in $M$. It is concluded from figure (12), $\theta$ increases in the central region and decreases near the channel walls for increasing in $Br$, but opposite behavior is occurring with the increase in $b$, as shown in figure (13). Figures (14-16) showed $\theta$ increases by increasing in $k_0, Gr$ and $F$. Figure (17) illustrated that $\theta$ increases near the right wall and the middle part of the channel and then gradually disappear as there is no effect on $\theta$ to the rest of the channel with an increase in $\phi_1$. Figure (18) explained the effect of $\phi_2$ on $\theta$. It is noticed that when an increase in $\phi_2$, the temperature increases at the left wall of the channel and merges from the central part to the rest of the channel (no effected). From figure (19) we noted that at an increase in $\overline{\phi}$, $\theta$ decreases at the left wall of the channel and merges from the central part to the right wall of the channel. The effects of $Br, Gr, F, \phi_1, \phi_2$ and $\overline{\phi}$ are consistent with the results analyzed in previous studies (Adnan and Abdulhadi [9] and Ali and Asghar [3]).
6.3 Concentration Distribution $\Omega$

The graphical results for concentration profile are illustrated in figures (20-30). Opposite behavior for concentration distribution is noticed compare with the temperature distribution. Figure (20) explain that the impact of $M$ on $\Omega$. It is noticed that $\Omega$ exhibits oscillating behavior with an increase in $M$. It is observed from figures (21-24), $\Omega$ decreases in the central region and increases near the channel walls for increasing in $Br, Sc, Sr$ and $F$, but opposite behavior is occurring with the increase in $b$, as shown in figure (25). Figures (26) and (27) deduced that $\Omega$ decreases by increasing in $k_0$ and $Bn$. Figure (28) shown that $\Omega$ decreases near the right wall and the middle part of the channel and then gradually disappear as there is no effect on $\Omega$ to the rest of the channel with an increase in $\phi_1$. Figure (29) illustrated the effect of $\phi_2$ on $\Omega$. It is noticed that when an increase in $\phi_2$, the concentration decreases at the left wall of the channel and merges from the central part to the rest of the channel (no effected). From figure (30) we concluded that at an increase in $\bar{\phi}$, $\Omega$ increases at the left wall of the channel while $\Omega$ decreases at the middle portion and then gradually disappear at the right wall of the channel.

6.4 Trapping Phenomenon

The process of the formulation of an internally circulation of fluid bolus by the closed stream line in the fluid flow is called trapping phenomenon, in which the trapped bolus moves ahead with peristaltic wave. The behavior of stream function is illustrated in figures (31-39) and the stream lines near the channel do nearly strictly follow the wall waves, which are mainly engendered by the relative movement of the walls. All figures are plotted for the values $M = 0.5, b = 0.2, k_0 = 2, Bn = 0.001, Br = 0.6, F = 1.8, \bar{\phi} = \pi / 4, \phi_1 = 0.2$ and $\phi_2 = 0.3$. We observed that the size of trapped bolus reduces with increasing $M, b$ and $\bar{\phi}$ whereas it enhances with increasing $k_0, \phi_1, \phi_2$ and $F$ as shown through figures (31-37) respectively. While figure (38) shown that the increasing values of $Br$, it has the slight effect always negligible at the size of the trapped bolus one can see it clear of a diagram streamline. The impact of $Bn$ is illustrate in figure (39), which shown that as $Bn$ increases, the size of the bolus increases at the left side wall and it reduces at the right side wall of the channel. These results agree with Adnan and Abdulhadi [9]. The result for $M$ and $k_0$ is also agree with Lakshminarayana et al. [1,8].

Fig. (38)- Effect of \( a Br = 1, \) \( b Br = 10, \) \( c Br = 20 \) on the stream line

Fig. (39)- Effect of \( a Bn = .1, \) \( b Bn = 1, \) \( c Bn = 1.3 \) on the stream line
7. Conclusions

In this paper, the influence of MHD on mixed convective heat and mass transfer analysis for the peristaltic transport of viscoplastic fluid with porous medium in tapered channel is investigated under low Reynolds number and long wavelength. The flow is considered in two-dimensional channel. The system of nonlinear partial differential equation was solved by using perturbation method. The present results have application in chemical engineering and biomedical system. In view of this study, some of the interesting conclusions are summarized as follows:

- By increasing $M$, the axial velocity decreases in the central region and it increases near the boundaries of the channel but the opposite occur for increasing $k_0$. the axial velocity increases over the whole cross-section with increasing $F$ and it decreases by increasing $b$.
- The axial velocity decreases near the left wall while it increases at the center of the channel by increasing $Bn$. Furthermore $Br$ has not effected on the axial velocity.
- The temperature increases with increasing $k_0, Gr, Br$ and $F$.
- Opposite behavior for concentration distribution is noted compared to temperature profile. Furthermore, the concentration decreases over the whole cross-section except near the boundaries of the channel it is increases with increasing $Sr$ and $Sc$.
- The temperature profile and concentration distribution exhibits oscillating behavior with increasing $M$.
- It is noted that the parameters $\phi_1, \phi_2$ and $\bar{\phi}$ have similar effected on the axial velocity and temperature profile but opposite behavior accrue for concentration distribution.
- The size of trapped bolus reduces with increasing $M$, $b$ and $\bar{\phi}$ whereas it increases with increasing $k_0, \phi_1, \phi_2$ and $F$. Furthermore the trapped bolus increases in number and size at the left wall of the channel by increasing $Bn$ but opposite behavior occur at the right wall.
